COMP4982 - Capstone

Team Discussion

After our group discussion, OtterWiki was selected as the target website. It is a dynamic wiki website that is lightweight, user-friendly, and simple, which doesn't take long to deploy and doesn't take up too many resources. The application installs more quickly than the other sites and runs without potential issues. It's a single-container design that makes it easy to deploy within a private Docker network, which consists of a single persistent volume. Additionally, this dynamic website includes a variety of pages, which help can be helpful when implementing a traffic generator on the website. The search bar is able to process queries, and the login/sign-up page is functional. Overall, this was our group's final decision for Otterwiki to serve as the target website for our web analytics service.
